

PUBLIC HEALTH REPORTS

VOL. 38

OCTOBER 19, 1923

No. 42

THYROID ENLARGEMENT AMONG SCHOOL CHILDREN OF GRAND RAPIDS, MICH.¹

In view of the suspected goiter prevalence in Grand Rapids, Mich., and stimulated by the recent work in the prevention of goiter by Marine and Kimball and the results obtained by Kimball in the prevention of simple goiter in Ohio,² Dr. C. C. Slemons, health officer of Grand Rapids, instituted a survey among the school children of that city in order to determine the exact degree of goiter prevalence among them and to learn whether or not preventive measures should be taken.

The survey included all of the school children of Grand Rapids, both boys and girls, of all grades from kindergarten through high school, including private, parochial, and public schools. Doctor Kimball took part in a large number of the examinations of girls in one of the high schools in order that a comparison might be made with the survey carried on in Ohio, in which only girls were included.

The classification adopted to facilitate the work consisted in designating normal thyroids No. 1; slightly enlarged thyroids, No. 2; greatly enlarged thyroids, No. 3; and those thought to be adenomas, No. 5.

Examinations were made without any appreciable interruption of the school routine. The children formed in line, each with a small card bearing his name, age, grade, and sex, and passed in turn by the examining physician, who classified them according to the above classification. A nurse made the entry on the cards. With the child facing a good light, the thyroid area was inspected, then palpated. Palpation of the gland while the child was in the act of swallowing frequently revealed slight enlargements that would not otherwise have been observed. Many cases of doubtful slight enlargement were classified as "normal" rather than "slightly enlarged," such classification being thought more desirable from the standpoint of incidence determination.

¹ A survey of thyroid enlargement among the school children of Grand Rapids. By Torrance Reed, M. D., and H. T. Clay, M. D. *The Jour. Mich. State Med. Soc.*, Vol. XXII, No. 8, August, 1923, pp. 323-325.

² The prevention of simple goiter. By O. P. Kimball, M. D. *Am. Jour. Pub. Health*, Vol. XIII, No. 2, February, 1923, pp. 81-87, and *Pub. Health Rep.*, Vol. 38, No. 17, April 27, 1923, pp. 877-885. (Reprint No. 832.)

Among 26,215 pupils examined, 30 per cent were found to have enlarged thyroids; and of this 30 per cent found affected, 32.7 per cent were boys and 67.3 per cent girls—an incidence approximately twice as high among girls as boys in this group of school children. It is stated, however, that the moderate and marked enlargements are probably in about the ratio of six or eight to one as compared with boys, and that the slight enlargements, sufficiently numerous among boys to bring the total incidence in boys to 50 per cent of that among girls, are the enlargements generally overlooked; and the authors believe that the failure to discover them results in the erroneous opinion that simple goiter is about eight times as prevalent among girls as among boys.

The following table is given showing the incidence of thyroid enlargement among the school children of Grand Rapids, classified by sex and by age groups under ten years of age and over ten years, respectively:

	Under 10.	Over 10.	Total enlargements.	Total examined.
Boys.....	623	1,938	2,561	12,631
Girls.....	1,073	4,205	5,278	13,584

It is shown that over 10 years of age the ratio of incidence in girls to that of boys is about $2\frac{1}{2}$ to 1, whereas under 10 years of age it is less than 2 to 1. In high schools the percentage of pupils affected ranged from 39 to 60 per cent.

No exophthalmic goiter was observed during the survey.

The officials of the health department of Grand Rapids, considering goiter prevention to be a public health measure and believing that such work can best be done by public health officers, and in view of the conditions revealed by the survey, have instituted preventive measures. The treatment consists in giving 10 milligrams of iodine weekly for 40 weeks throughout the school year. The iodine, in the form of a chocolate confection, prepared by a reliable pharmaceutical firm, is given by the school nurse. Before being given treatment each child is required to have the written consent of his parents.

It is yet too early for any results from the prophylaxis to be available.

FURTHER RELATIVE TO MOSQUITO CONTROL AT BRUNSWICK, GA.

A recent report from the quarantine station at Brunswick, Ga., shows continued success with mosquito-control measures employed in that locality during the current year.¹

¹ Public Health Reports, Aug. 24, 1923, p. 1965.

The mosquito-extermination campaign was begun in the fall of 1922 and has been carried on under the supervision of the local board of health, assisted by the sanitary committee of the Brunswick Chamber of Commerce. The physicians of the community took an active interest in the educational feature of the work and took the opportunity on the occasions of professional visits to explain the rôle of the fly and mosquito in carrying disease and to emphasize the necessity for the cooperation of every person in order to wage a successful fight against these pests. Such instruction and advice coming from authoritative sources is said to have done more to arouse the people than could have been accomplished by the distribution of literature. His interest aroused, each householder became a self-appointed inspector of his own premises and kept them free from breeding places for flies and mosquitoes. Under the supervision of an officer in charge of the control work, all places likely to retain surface water after rains were drained wherever it was practicable to do so. Ponds and lakes not susceptible of drainage were either oiled or stocked with top minnows.

The results of this work have been decidedly evident, and the absence of mosquitoes during a season particularly favorable for their reproduction has been a revelation to the community in what can be accomplished by cooperative effort. It is stated that the health conditions in Brunswick and in Glynn County have been unusually favorable during the year, with a reduction in the number of cases of malaria, typhoid fever, and diarrheal diseases, and no case of dengue being reported.

SOME VITAL STATISTICS FOR GERMANY.

PRUSSIA, 1912, 1913, 1920, 1921.

The following data on vital statistics for Prussia, furnished by the American consul, were taken from the annual statistics for the State of Prussia for 1921:

Year.	Population.	Deaths (exclusive of suicides).	Suicides.	Births.	Infant deaths (under 1 year).
1912.....	41,300,000	636,303	8,793		
1913.....	41,900,000	620,455	9,214	1,173,416	175,989
1920.....	38,000,000	581,209		972,696	130,556
1921.....	38,300,000	529,870	7,559	968,768	129,939

Deaths from excessive indulgence in alcoholic liquor were given as follows: In 1912, 936; in 1913, 913; in 1920, 155; and in 1921, 297.

Divorces.—A conspicuous increase in divorces is noted from a pre-war divorce record of from 4,000 to 9,000 annually, to 13,261 in 1919, 23,059 in 1920, and 25,836 in 1921.

MARRYING AGES OF CITIZENS OF BADEN.

Data collected by the statistical office of the Government of Baden indicate that there is a tendency among all professions in Baden, Germany, to marry earlier than was the case before the war. In view of the general current conception of economic conditions throughout Germany, this would at first hand appear to be an anomalous situation. In the report it is suggested that the change may be due in part to the abolition of military service and in part to the comparatively better pay which young workers are receiving. It may also be due in part to a different age constitution of the male population as a result of the war. The percentage of workers 20 to 25 years of age married in 1912 is given as 40.9, whereas in 1922 it was 43.4. It is also noted that older bachelors show more inclination toward matrimony than they did before the war. The percentage of peasants marrying at an age of over 35 years was 8.4 per cent in 1912 and 17 per cent in 1922. The increase is stated to be still greater among factory workers and professional people.

Of 243 professional men (lawyers, professors, physicians, ministers) married in Baden in 1922, one-third were between the ages of 30 and 35 years, one-third between 25 and 30 years, 15 per cent were over 40 years, and only 6 per cent between 20 and 25 years.

Workers were stated to have married much earlier. Of 4,376 factory workers married in 1922, 82 per cent were from 20 to 30 years of age (more than half of these being between 20 and 25 years of age).

Peasants were found to marry between the marrying ages of professional men and of factory workers. Of 2,951 peasants who married in 1922, 39 per cent were between 25 and 30 years of age, and 25 per cent between 30 and 35.

INTERNATIONAL ASSOCIATION FOR THE PROMOTION OF CHILD WELFARE.

Second Ordinary Session Held at Geneva July 28-30, 1923.

Among the subjects dealt with at the second ordinary session of the International Association for the Promotion of Child Welfare, held at Geneva July 28-30, 1923, were questions relating to the regulation of infant rearing centers, the improvement of day nurseries, school hygiene, and the repatriation of juvenile delinquents. Resolutions were adopted as follows:

1. *Regulation of infant rearing centers.*—Because of the difficulty in supervising the care of infants placed out promiscuously, it was recommended that "rearing centers" be established, directed by qualified medical officers.

2. *Improvement of crèches.*—(a) All crèches, or day nurseries, should be under the direction of a physician; (b) they should have separate rooms for the cradles, for the linen, for disinfecting purposes, and for isolating patients; and (c) they should be open to the pupils of puericulture schools.

3. *School hygiene.*—There should be close collaboration between the teacher, the school physician, and the school nurse. The teacher should have a knowledge of the fundamental rules of hygiene. Each child should undergo a yearly examination, records should be kept, and proper action should be taken as indicated by the examination. From a prophylactic point of view, the attention of the public authorities is called (a) to importance of the medical examination from the standpoint of the teacher and (b) to the importance of dental hygiene and treatment.

Convention for the repatriation of destitute or juvenile delinquents.—The approved draft of this convention provides (in 12 articles) for the repatriation of minors of foreign nationality by the contracting States, with particular reference to those minors without means of protection or support, and escaped delinquents, who have been taken from the authority of their parents or guardian. In every case the minor is handed over by virtue of a decision duly given by the authorities of the State of which he is a native. Provisions are made for the ratification of the convention, which comes into operation as regards each signatory State one month from the date of deposit of certificate of ratification, and for denouncement of the convention by any signatory State.

CITY HEALTH OFFICERS, 1923.

Directory of Those in Cities of 10,000 or More Population.

Directories of the city health officers in the cities of the United States having a population of 10,000 or more have been published in The Public Health Reports ¹ for each year from 1916 to 1922, for the information of health officers and others interested in public health activities. These directories have been compiled from data furnished by the health officers. The cities included in this directory are those having 10,000 population or more according to the census of 1920.

¹ Reprints Nos. 346, 416, 494, 539, 599, 702, and 767 from the Public Health Reports.

The asterisk (*) indicates that the officer so designated has been reported to be a "whole-time" health officer. For this purpose a "whole-time" officer is defined as "one who does not engage in the practice of medicine or in any other business, but devotes all his time to official duties."

CITY REPORTS FOR WEEK ENDED SEPTEMBER 29, 1923.

CEREBROSPINAL MENINGITIS.

The column headed "Median for previous years" gives the median number of cases reported during the corresponding week of the years 1915 to 1922, inclusive. In instances in which data for the full eight years are incomplete, the median is that for the number of years for which information is available.

City.	Median for previous years.	Week ended Sept. 29, 1923.		City.	Median for previous years.	Week ended Sept. 29, 1923.
